Use of Bi-polar cables with flying leads

EN 60601-2-2:2011 is the current European Standard that should be referred to by all manufacturers of medical electrical product. Part 2-2 outlines the requirements for the basic safety and essential performance of high frequency surgical equipment and high frequency surgical accessories.

The issue of flying leads for bi-polar is covered in section 201.12.2 titled Usability Detailed as follows: -

Active output terminals on HF surgical equipment and associated equipment shall differ in configuration sufficiently such that Monopolar active accessories, neutral electrodes and Bipolar active accessories cannot be improperly connected.

Active connectors having more than one pin shall have FIXED pin spacing. "Flying leads" are prohibited.

The EN 60601-2-2: 2011 standard, when adopted by the home nation of the company manufacturing the accessories (i.e. when the standard becomes the 'current' Standard in use by that Country), then all bipolar cables manufactured 'should' be manufactured with only fixed pin spacing.

It is the manufacturer that must be compliant to the standard when producing bipolar cables.
